

# GHARMULYA: Nepal Property Price Prediction

**s** by sabina karki

Made with GAMMA

# Project Summary

## Problem

Lack of accessible, reliable house price estimates in Nepal.

## Solution

ML-based web app (GHARMULYA) predicts prices based on features.

## Impact

Helps users estimate fair market value before buying/selling.

# Team Roles

## **Sabina: Frontend development & Data collection**

Web scraping, UI design (React), user flows.

## **Sudha: ML development**

Data preprocessing, model training & evaluation.

## **Ganga: Backend Development**

API creation, Flask integration, connecting frontend.

### ▼ Problem Statement & Solution

✓ Addressing Lack of Reliable House Price Estimation	be be2022se80...	May 1	Planning		
✓ Develop a House Price Prediction System for Nepal	be be2022se83...	May 1	Planning		
✓ Implement Linear Regression Algorithm for Price Pre	be be2022se83...	May 1	Develop...	Linear R...

# Planning Process

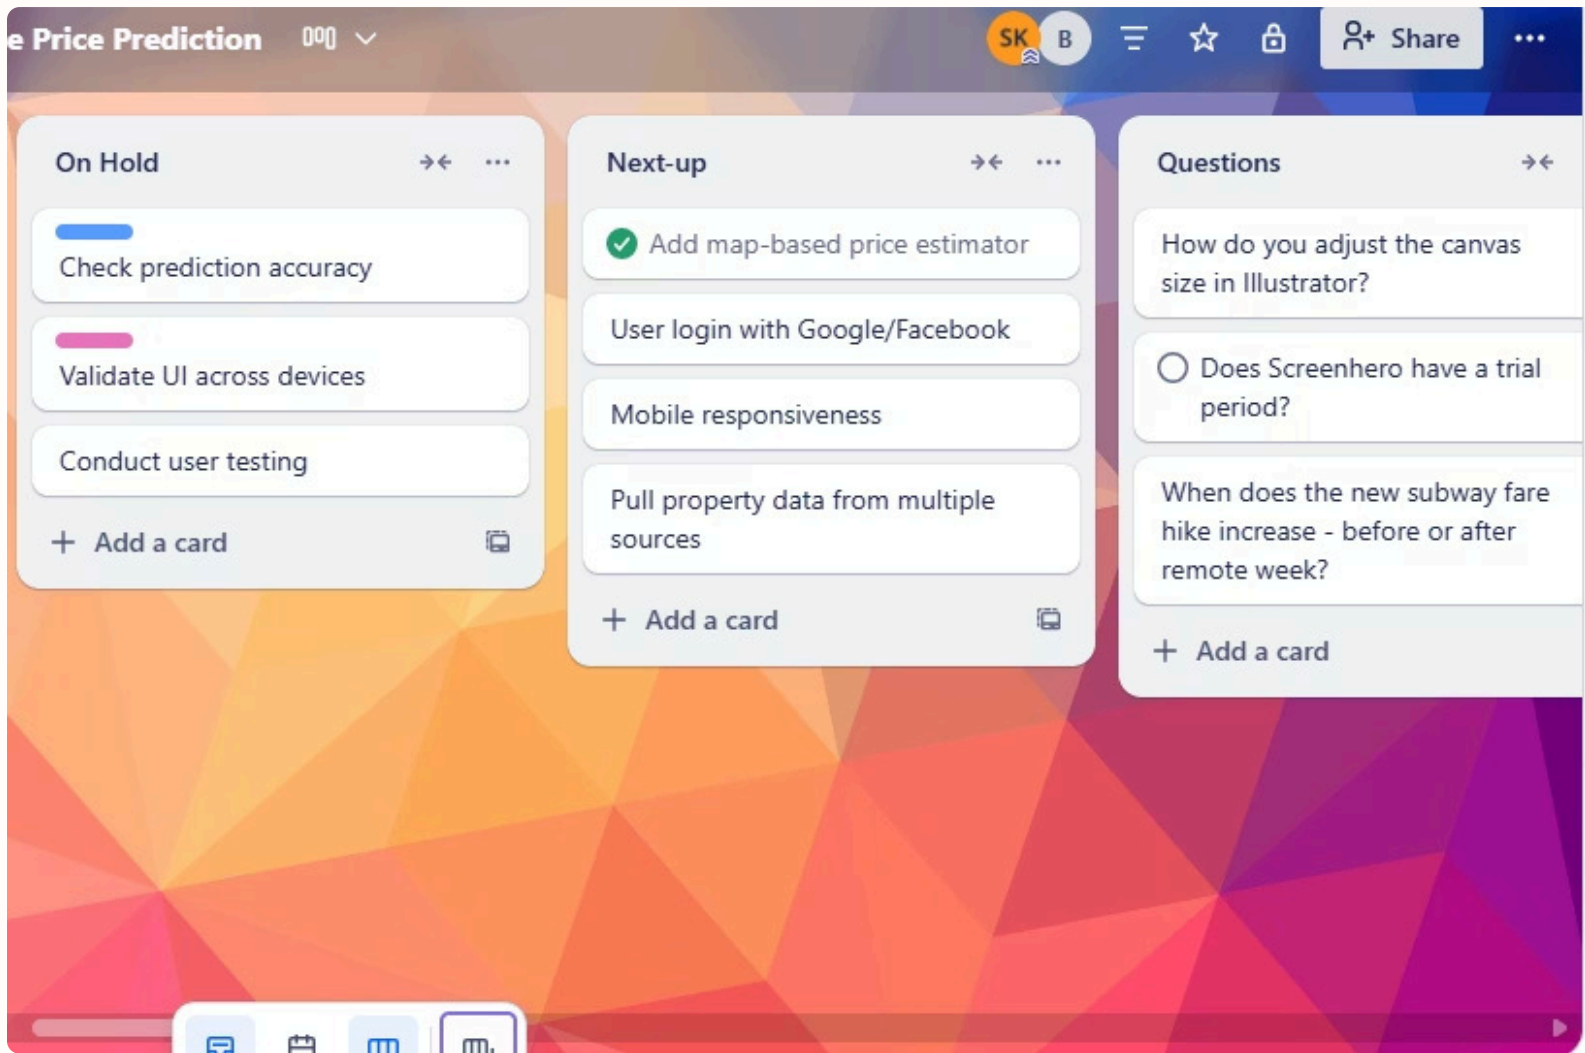

## Tools Used

- Trello for backlog and sprint planning.
- GitHub for codebase and versioning.
- Google Meet for standups.

## Backlog Creation

- Started with epics: Data, ML model, Frontend.
- Broke into user stories: "Scrape 50 listings," "Train model."
- Prioritized by user value.

# Streitn

## Sprint Demonstrations

### Sprint 1

Scraped and cleaned data; designed wireframes.

### Sprint 2

Trained regression model (80%  $R^2$ ); created prediction API.

### Sprint 3

Built responsive UI; integrated ML model with frontend.

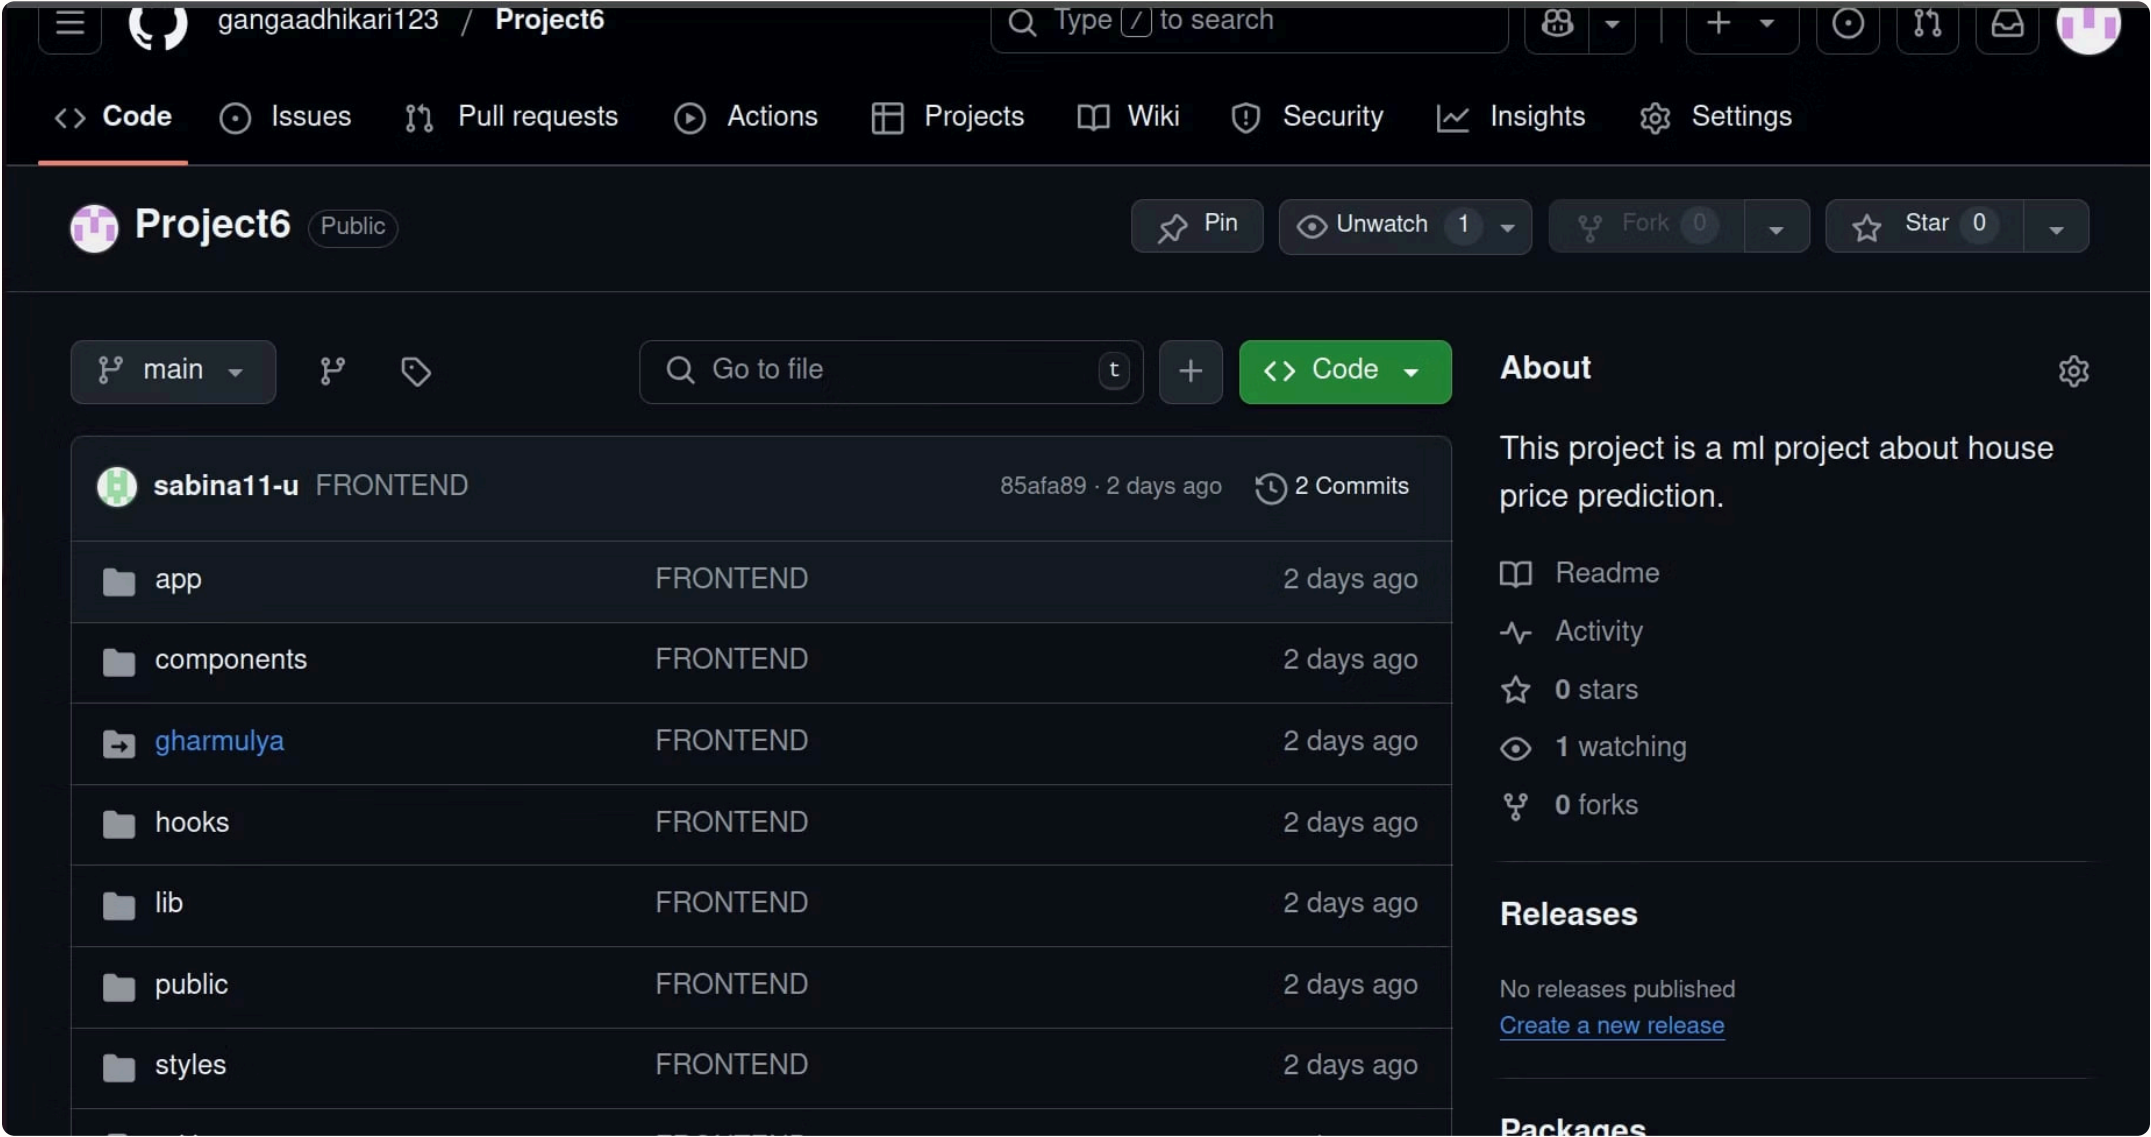

# Retrospective Learnings

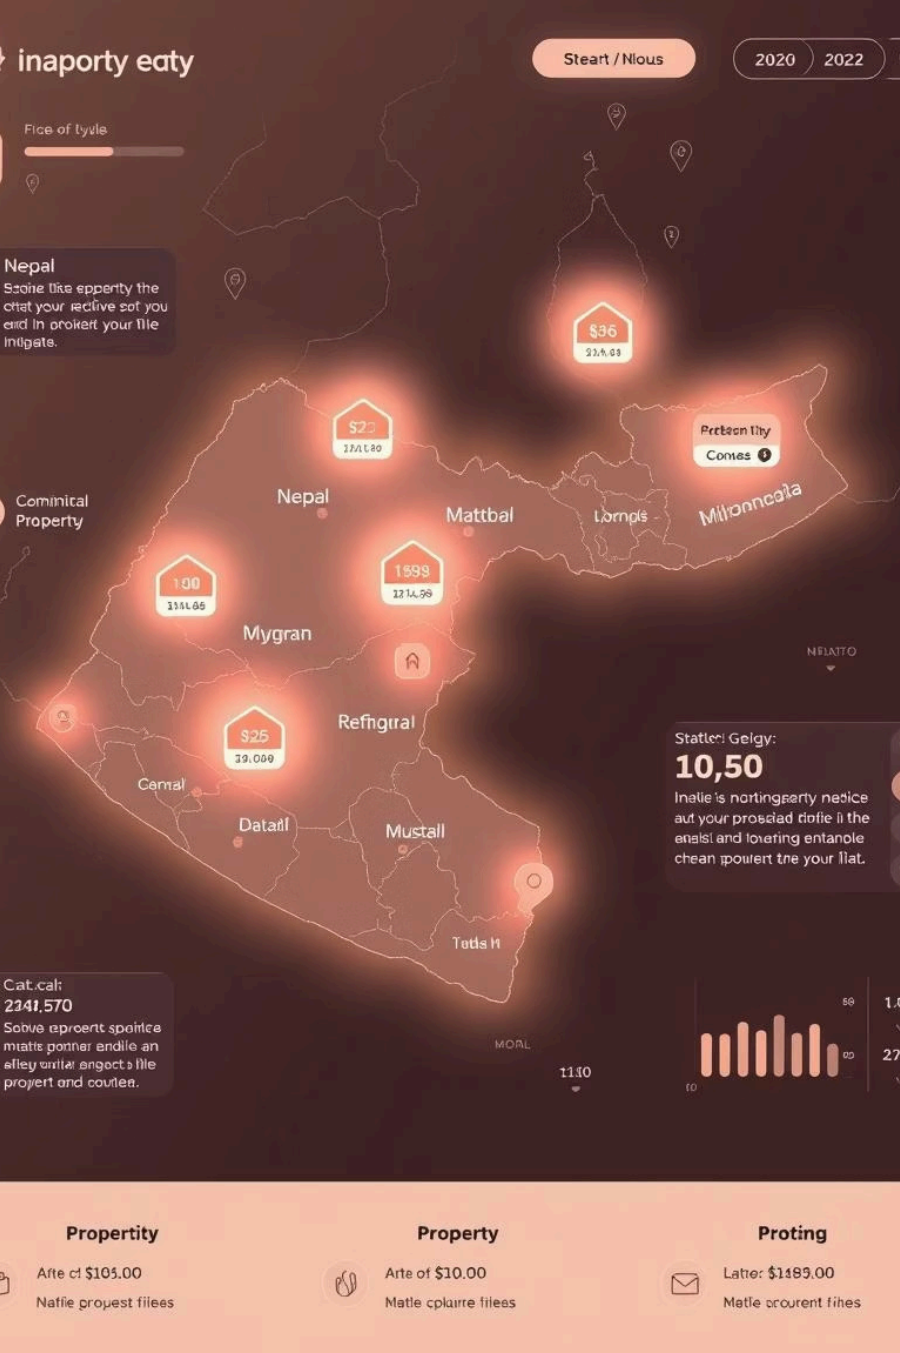

## What Went Well

- Agile helped adapt to changes.
- Clear communication in a small team.

## Challenges & Changes

- Data cleaning took longer.
- UI/backend version conflicts.
- Simplified frontend, re-trained model.

# Next Steps

## Future Enhancements

Add authentication (Google/email login).

## Deployment

Deploy fully online (GCP or Heroku).

## Data & Visualization

Increase dataset size; add map-based price visualization.
